

## # Depth-limited Search :-

- ↳ To avoid  $\infty$  depth problem of DFS, we decide to search only until depth  $l$ .
- ↳ Treating all nodes at depth  $l$ , as if they have no successors.

## # Pseudo algorithm :-

take  $S$  as an empty stack

$S$ .push (start)

mark start as visited

while ( $S$  is not empty)

{

$t = S.pop()$

if ( $t \equiv g$ )  $\rightarrow$  return  $t$  ;  $\rightarrow$

else if (depth( $t$ )  $> l$ )  $\rightarrow$  continue ;

else

{

for all neighbours  $t'$  of  $t$

{

if ( $t'$  is not visited)

{

$S.push(t')$

mark  $t'$  as visited.

}

}

}

}

$\rightarrow$

$S \rightarrow$  stack

start  $\rightarrow$  starting node.

$g \rightarrow$  goal state.

$\rightarrow$  skip the successors  
if depth reached beyond  
 $l$ .

# # Performance analysis :-

1. Complete :- Yes if  $d < l$ , else not

$Q = 15$

State.

(A)

30 cities

2. Time Complexity :-

$$\text{time complexity} = O(b^l)$$

;  $m \equiv l$  = maximum depth.

3. Space :-

$$\text{Space complexity} = O(b * l)$$

4. Optimal :- No, (Same as DFS).

# Iterative - deepening Search :-

↳ pseudo - algorithm :-

for depth,  $d' = 0$  to  $\infty$

{

$x = \text{depth-limited-search}(\text{start}, d')$

if ( $x \equiv g$ )  $\rightarrow$  return  $x$ ;

}

eg.

limit = 0 I iteration

limit = 1.

limit = 2.

limit = 3

limit = 4.

Goal states = {J, F}

I - iteration

II - iteration

III - iteration

IV iteration

V - iteration

## # Performance analysis :-

1. Complete :- Yes it's complete, the search will only terminate at depth  $d$ .

$$\underline{d} \leq \underline{m}$$

$$\underline{d}' \rightarrow 0, 1, 2, \dots, \underline{d}$$

## 2. Time :-

$$\begin{aligned} &= (d+1) b^0 + (d) b^1 \\ &\quad + (d-1) b^2 \\ &\quad + (d-2) b^3 \\ &\quad \vdots \\ &\quad + (2) b^{d-1} \\ &\quad + \boxed{b^d} \end{aligned}$$

$$\boxed{\begin{array}{l} \text{time} = O(b^d) \\ \text{Complexity} \end{array}}$$

In previous iteration all nodes at depth  $d-1$  were explored.

3. Space :-

$$\boxed{\text{Space complexity} = O(\log d)}$$

→ applying DFS,  
 $\boxed{m = d}$

4. Optimal :- Yes, if step count = 1.
