

PAPER CODE: BCE-P624
SEMESTER EXAMINATION (MAY-2026)
CLASS: B.TECH. SEMESTER: VI
SUBJECT: CSE
PAPER TITLE: MACHINE LEARNING - 2

Time: 3 Hours

Max. Marks: 70

Note: Question Paper is divided into two sections: **A and B**. Attempt both the sections as per given instructions.

SECTION-A (SHORT ANSWER TYPE QUESTIONS)		CO	BL
Instructions: Answer any <i>five</i> questions in about 150 words each. Each question carries six marks. (5 x 6 = 30 Marks)			
Q-1	What is the difference between regression and classification in Machine Learning? Give examples.	CO2	B2
Q-2	(a) Define the Sigmoid Function. - Calculate its output for $z=0$, $z=-2$ and $z=-2$. (b) Given input vector is $z=[2,1,0]$ Find - Compute the softmax probabilities for each element. - Verify that the sum of probabilities equals 1.	CO2	B3
Q-3	What is Clustering and how is it different from classification?	CO4	B2
Q-4	Explain how Random Forests reduce overfitting compared to a single decision tree.	CO2	B2
Q-5	Explain the top-down approach for constructing a decision tree.	CO3	B3
Q-6	Explain the concept of a Decision Tree . What are splitting criteria commonly used?	CO2	B2
Q-7	Differentiate between linear SVM and non-linear SVM .	CO2	B2
Q-8	Explain the steps of an end-to-end machine learning model development pipeline .	CO2	B2
Q-9	What is DBSCAN ? How does it differ from K-Means and hierarchical clustering?	CO5	B2
Q-10	Write a Python program to perform classification using the K-Nearest Neighbours (KNN) algorithm. Tasks: - Load the Iris dataset using <code>sklearn.datasets</code>. - Split the dataset into training (70%) and testing (30%) sets. - Train a KNN classifier with $K = 3$. - Predict class labels for the test dataset. - Calculate and print the accuracy of the model. Note: - Use <code>train_test_split</code> from <code>sklearn.model_selection</code> - Use <code>KNeighborsClassifier</code> from <code>sklearn.neighbors</code> - Use <code>accuracy_score</code> from <code>sklearn.metrics</code>	CO4	B3

SECTION-B (LONG ANSWER TYPE QUESTIONS)			CO	BL																							
Instructions: Answer any <i>four</i> questions in detail. Each question carries 10 marks. (4 x 10 = Marks)																											
Q-1	Define Linear Regression and write its hypothesis equation for one variable.	CO1	B2																								
Q-2	(a)Define log loss (cross-entropy loss) and explain why it is used instead of mean squared error. (b)Given: - Predicted probability = 0.8, actual label = 1 - Compute the log loss.	CO5	B4																								
Q-3	Given predicted probabilities and actual class labels: <table><tr><th>Sample</th><th>Probability</th><th>Actual</th></tr><tr><td>A</td><td>0.85</td><td>1</td></tr><tr><td>B</td><td>0.75</td><td>0</td></tr><tr><td>C</td><td>0.65</td><td>1</td></tr><tr><td>D</td><td>0.55</td><td>0</td></tr><tr><td>E</td><td>0.45</td><td>1</td></tr></table> Find: - Compute TPR and FPR at different thresholds. - Plot the ROC curve points. - Calculate the AUC using the trapezoidal rule.	Sample	Probability	Actual	A	0.85	1	B	0.75	0	C	0.65	1	D	0.55	0	E	0.45	1	CO3	B4						
Sample	Probability	Actual																									
A	0.85	1																									
B	0.75	0																									
C	0.65	1																									
D	0.55	0																									
E	0.45	1																									
Q-4	Given the following dataset: <table><tr><th>Point</th><th>x1</th><th>x2</th><th>Class</th></tr><tr><td>A</td><td>1</td><td>2</td><td>C1</td></tr><tr><td>B</td><td>2</td><td>3</td><td>C1</td></tr><tr><td>C</td><td>3</td><td>3</td><td>C2</td></tr><tr><td>D</td><td>6</td><td>5</td><td>C2</td></tr><tr><td>E</td><td>7</td><td>7</td><td>C2</td></tr></table> A new point P(3, 2) is to be classified. Tasks: - Compute Euclidean distance between P and all data points. - Find the 3 nearest neighbors (K = 3). - Determine the class of P using K-NN. - Repeat classification using weighted KNN (weight = 1/distance).	Point	x1	x2	Class	A	1	2	C1	B	2	3	C1	C	3	3	C2	D	6	5	C2	E	7	7	C2	CO3	B4
Point	x1	x2	Class																								
A	1	2	C1																								
B	2	3	C1																								
C	3	3	C2																								
D	6	5	C2																								
E	7	7	C2																								
Q-5	Given the following dataset:	CO4	B4																								

	Sample	Outlook	Temperature	PlayTennis		
	1	Sunny	Hot	No		
	2	Sunny	Hot	No		
	3	Overcast	Hot	Yes		
	4	Rain	Mild	Yes		
	5	Rain	Cool	Yes		
	6	Rain	Cool	No		
	7	Overcast	Cool	Yes		
	8	Sunny	Mild	No		
	9	Sunny	Cool	Yes		
	10	Rain	Mild	Yes		
	Tasks: 1. Calculate Entropy of the target variable PlayTennis. 2. Compute Information Gain for the attribute Outlook. 3. Determine the root node of the decision tree. 4. Show the first level of the decision tree after splitting by the best attribute.					
Q-6	Discuss how to evaluate and deploy a machine learning model in a real-world scenario (e.g., web app or automated prediction system).				CO4	B3
Q-7	Write a Python program to build and evaluate regression models. Tasks: 1. Load the California Housing dataset using sklearn.datasets. 2. Perform preprocessing: - Handle missing values (if any) - Scale features using StandardScaler 3. Split the dataset into training and testing sets. 4. Train the following models: a) Linear Regression b) Random Forest Regressor 5. Predict outputs on test data. 6. Evaluate both models using: - RMSE (Root Mean Squared Error) - R² Score 7. Compare both models and states which performs better.				CO5	B4
Q-8	Write a Python program to implement Linear Regression using the Least Squares Method and visualize the result. Tasks: 1. Create a simple dataset (or use a sample dataset). 2. Fit a linear regression model using least squares method. 3. Predict output values. 4. Plot: - Original data points (scatter plot) - Best-fit regression line 5. Label axes and add titles to the graph. Use: - numpy for calculations - matplotlib for visualization				CO6	B4
